

$$\begin{aligned}
 6) CI &= \text{stat} \pm 2.0 \sigma / \sqrt{n} \\
 &= 68 \pm 1.96 \cdot 1.18 \\
 &= 68 \pm 2.32
 \end{aligned}$$

Janet	Tom	Georgia	Peter
20%	60%	15%	5%
$1/20$	$1/10$	$1/10$	$1/20$

$$.01 \quad .06 \quad .015 \quad .0025$$

$$(.1) / (.1 + .06 + .015 + .0025) = .11$$

$$P = .11$$

a) Coffee	muffin
mean = 1.4	mean = 2.5
SD = .3	SD = .15

$$\begin{aligned}
 \text{mean} &= 1.4 + 2.5 = 3.9 = \text{mean} \\
 \text{SD} &= .3 + .15 = .45 = \text{SD}
 \end{aligned}$$

$$\begin{aligned}
 b) \text{mean} &= 3.9 \cdot 7 = 27.3 = \text{mean} \\
 \text{SD} &= .45 \cdot 7 = 3.15 = \text{SD}
 \end{aligned}$$

$$\begin{aligned}
 11) \text{total} &= 2500 \\
 \text{space} &= 1786 \\
 P &= .7
 \end{aligned}$$

$$.7 \cdot 2500 = 1750 \rightarrow 1750 < 1786 \rightarrow \text{there is a 0\% chance of there not being enough space}$$

$$13) H_0: \text{The mean resting pulse rate of those who do not exercise is the same or less than those who do}$$

$$\mu_{\text{not}} \leq \mu_{\text{do}}$$

$$H_1: \text{The mean resting pulse rate of those who do not exercise is greater than those who do}$$

$$\mu_{\text{not}} > \mu_{\text{do}}$$

Independent T:

$$DF = 16 + 12 - 2 = 26 \rightarrow \text{crit } T = 1.71$$

$$t = (73.9 - 69.1) / \sqrt{[(10.9^2/16) + (8.2^2/12)]} = 4.8 / \sqrt{7.425 + 5.633} = 4.8 / 3.609 = 1.329$$

$$1.329 < 1.71 \rightarrow \text{reject the null}$$

We reject the null hypothesis that  $\mu_{\text{not}} \leq \mu_{\text{do}}$  and accept the alternative that  $\mu_{\text{not}} > \mu_{\text{do}}$

$$16) a) Y/X \rightarrow (y_i - \bar{y})(x_i - \bar{x}) / (x_i - \bar{x})^2 \rightarrow yx/x^2 = Y/X$$

$$\text{slope} = 296446.059 / 147911.938 = 2.004 = \text{slope}$$

$$107.43 = (128.88)(2.004) + y$$

$$107.43 = 258.70 + y$$

$$y \text{ intercept} = -150.87$$

This doesn't make sense because time has to be positive but I don't have enough time to fix it

$$b) \text{For every unit increase in distance, time increases by } 2.004$$

$$\text{When distance} = 0, \text{ time} = -150.87$$

$$c) XY / \sqrt{X^2 Y^2} \rightarrow (147911.938 \cdot 148287.811) / \sqrt{(147911.938^2 \cdot 148287.811^2)} = 1$$

$$d) SSE = 1185784.23$$

It's the average error in times reported vs actual and then squared

$$e) Y = (103)(2.004) - 150.87$$

$$Y = 55.542$$

$$15) a) R^2 = .7480$$

$$b) \text{slope} = 7.079$$

$$\text{Intercept} = -28.53$$

As unemployed goes up 1, numbers go up by 7.079

At 0 unemployment, there are -28.53 numbers (this makes no sense, but I have no time)

c) I don't know and I'm out of time :)
